

AI-Assisted Game Development

One-Day Workshop Agenda — From CLI-from-Scratch to Living Code

Prepared for Panteon Games — Codeo

This program is designed for a team that already uses Claude Code daily: no tool introductions, just practice. In the morning, Unity CLI is learned from scratch — from an empty scene to a playable mini game, everyone hands-on. The day then moves to Unity's official match-3 sample, Gem Hunter Match (~4,800 lines): working with an agent inside a living codebase you did not write. The tracks run back to back with a single trainer; anyone is welcome to sit in on the other track. The art approval process and the baseline metrics are put on record during the day.

MORNING — JOINT SESSIONS (ALL TEAMS)

09:30 – 10:00	Opening — The core principle ("tools do the producing, people make the final call"), the art approval process and provenance; the baseline metrics template is handed out. Meeting Gem Hunter Match: everyone plays the game once.
10:00 – 11:00	Unity CLI From Scratch — Hands-On (Coin Rush) — The three layers (the unity command, com.unity.pipeline, eval) and [CliCommand]; then everyone starts from an empty scene: ground and player via eval from the terminal, PlayerController written by the agent in plan mode, the coin prefab and ring of 8, remaining coins counted from the terminal. No mouse.
11:00 – 11:15	Break
11:15 – 12:30	The Agent in a Foreign Codebase + Live Demo: BUG-312 — Three techniques: code archaeology (map, then verify), a CLAUDE.md contract for code you did not write, git-checkpoint sync (./catchup.sh). Then the full-loop demo: the move-counter complaint, call-site analysis of LevelData.Moved(), eval proof (20»19), a one-line fix, proof again (20»20).
12:30 – 13:30	Lunch

AFTERNOON — SEQUENTIAL TRACKS, ONE TRAINER

13:30 – 15:00	Track A · Gem Hunter Engineering Lab — Engineering + DevOps — 9 exercises, compressed: architecture discovery (Ex01) and the CLAUDE.md contract (Ex02) hands-on; level data, the combo counter and the 7th gem (Ex03–05) as demos; the BUG-312 root-cause hunt (Ex06) and the level_lint command (Ex07) hands-on; the Cross Bomb ticket (Ex08) briefed for after the workshop; the iOS build (Ex09) as a demo. Anyone who falls behind syncs with one command via ./catchup.sh.
15:00 – 15:15	Break
15:15 – 16:45	Track B · Reskinning Gem Hunter — Art + Tech Art — Producing a 7-gem set from the studio style model, cleanup and the sprite import standard, sprite swaps on the prefabs (through the CLI); then adapting the 2D lighting and match VFX to the new palette, in-game verification and the approval package (checklist + provenance + before/after).

CLOSING — JOINT SESSION

16:45 – 17:30	The Combined Game and Next Steps — Track A's features + Track B's reskin merge on one branch; the iOS build is made from the terminal. The agent's four traps in foreign code; concrete steps for the next 90 days and the metrics calendar.
---------------	---

PRE-WORKSHOP PREPARATION

Projects	coin-rush-workshop (for the morning session) and gem-hunter-workshop (checkpoint branches + com.unity.pipeline) cloned and opened once on participant machines.
Accounts	Engineers: Claude Code access (already in daily use on the team). Art: access to the Scenario style model and Meshy (backup: a pre-generated gem set).
Venue	One workshop room, projection, and one machine per lab participant.
