

Before the Workshop

Participant setup — do this the day before, not the morning of

AI-Assisted Game Development · Panteon Games × Codeo · about 45 minutes, mostly waiting for downloads

The workshop is hands-on from the first hour: you will drive a running Unity editor from the terminal and let Claude Code work inside two real projects. Everything below has to be true on **your own laptop** when you walk in — the first open of a Unity project takes several minutes, and we will not have that time on the day. Work through the steps in order; the self-check at the end tells you whether you are done.

1 · INSTALL

1. Unity Hub and Editor 6000.4.7f1

Install Unity Hub, then from Hub install editor version **6000.4.7f1** exactly (both projects are pinned to it). Tick the **iOS Build Support** module — the last exercise builds for iOS. Xcode itself is optional: the build stops at signing either way, and that is fine.

2. Unity CLI

In a terminal:

```
curl -fsSL https://public-cdn.cloud.unity3d.com/hub/prod/cli/install.sh | UNITY_CLI_CHANNEL=beta bash
```

Open a **new** terminal window afterwards, then check: `unity --version` should print a version (1.0.0-beta.5 or later).

3. Claude Code, git, GitHub access

Claude Code signed in with your account (you use it already — just confirm claude starts). `git --version` works. You have accepted the GitHub invitation to **thickiran/gem-hunter-workshop** and **thickiran/coin-rush-workshop** — both are private; if you cannot open them in a browser, ask before the day.

2 · CLONE AND OPEN — BOTH PROJECTS

4. Clone

```
git clone https://github.com/thickiran/gem-hunter-workshop.git
git clone https://github.com/thickiran/coin-rush-workshop.git
```

Put them somewhere without spaces in the path (for example your home folder). Do not download a ZIP — the Gem Hunter project needs its git branches.

5. Open each project once (this is the slow part)

```
unity open ~/gem-hunter-workshop
```

The first open builds the project cache and downloads packages: expect 3–10 minutes with the editor apparently doing nothing. Wait until the editor is fully up with no dialog boxes, then quit it and do the same for Coin Rush:

```
unity open ~/coin-rush-workshop
```

If the editor offers to *upgrade* the project or asks about Safe Mode, choose **no** / **Ignore** and tell us on the day.

3 · VERIFY

6. The CLI can talk to the editor

With one of the projects open in Unity, in a terminal:

```
unity status
```

You must see the project listed with state **ready**. Then prove the connection with a live command:

```
unity command eval 'return 1+1;'
```

→ 2. If `unity status` lists nothing, the editor is not fully up yet (wait), or it is in Safe Mode (close it and reopen the project).

7. Gem Hunter's checkpoints are there

```
cd ~/gem-hunter-workshop
./catchup.sh list
```

You should see complete and ex01–start ... ex09–start. If the list is empty: `git fetch --all`, then try again. Then play the game once: open `Assets/GemHunterMatch/Scenes/Level1.unity`, press Play, finish or lose the level — notice the move counter and the goals at the top.

8. Coin Rush opens at the first exercise

In the Coin Rush project, open `Assets/Workshop/Ex01_SceneSetup/Ex01_Start.unity` and read `Assets/Workshop/README.md` — it explains the folder-per-exercise layout you will use in the morning.

4 · ACCOUNTS BY TRACK

Track	What you need
Engineering + DevOps	Claude Code access (step 3). Nothing else.
Art + Tech Art	A Scenario account with the studio style model visible in it — open Scenario in a browser and confirm you can generate one image before the day. If you cannot get access, tell us: a pre-generated gem set will be available as a fallback and you can still do every step from cleanup onwards.
Both	You are welcome to sit in on the other track in the afternoon; no extra setup needed.

5 · SELF-CHECK — ALL BOXES BEFORE YOU ARRIVE

- ☐ Unity 6000.4.7f1 installed with iOS Build Support; `unity --version` works in a fresh terminal.
- ☐ Both repos cloned with git (not ZIP); each opened once in Unity without dialogs left open.
- ☐ `unity status` shows the open project as **ready**; `unity command eval 'return 1+1;'` prints 2.
- ☐ `./catchup.sh list` in gem-hunter-workshop prints ten checkpoints; you have played Level 1 once.
- ☐ `claude` starts in a terminal. Art track: Scenario account works and the style model is visible.
- ☐ Laptop charger and, for iOS, nothing extra — provisioning profiles are not part of the day.

Stuck on any step? Send a screenshot of the terminal output to the workshop channel before the day — most problems take two minutes to fix remotely and twenty in the room.
