

# AI in a Real Codebase

## Advanced Workshop Agenda — Gem Hunter

### Prepared for Panteon Games — Codeo

The first workshop taught building a game from scratch; this advanced workshop teaches what is harder and more valuable: working with an agent inside a living codebase you did not write. The whole day is spent on Unity's official match-3 sample, Gem Hunter Match (~4,800 lines). The morning sessions are joint; in the afternoon, engineering extends the game and hunts bugs while the art team reskins the same game in the studio style. At the closing, the work of both tracks merges into a single build.

### MORNING — JOINT SESSIONS (ALL TEAMS)

|               |                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 09:30 – 10:00 | <b>Opening</b> — 90 days since the first workshop: metrics review (T1–T3, rejection rate). The goal for the day and meeting Gem Hunter Match: everyone plays the game once.                               |
| 10:00 – 10:45 | <b>The Agent in a Foreign Codebase</b> — Three techniques: code archaeology (map, then verify), a CLAUDE.md contract for code you did not write, and staying in sync with git checkpoints (./catchup.sh). |
| 10:45 – 11:00 | Break                                                                                                                                                                                                     |
| 11:00 – 12:30 | <b>Live Demo: BUG-312</b> — A real live-game complaint: the move counter drops 'by itself'. Discovery, call-site analysis of LevelData.Moved(), eval proof (20»19), a one-line fix, proof again (20»20).  |
| 12:30 – 13:30 | Lunch                                                                                                                                                                                                     |

### AFTERNOON — PARALLEL TRACKS (13:30 – 16:45)

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Track A<br/>Engineering +<br/>DevOps</b> | <b>The Gem Hunter Lab</b> — 9 exercises: architecture discovery (ARCHITECTURE.md), the agent contract, tuning difficulty through level data, a combo counter, the 7th gem (Amethyst), the BUG-312 root-cause hunt, the level_lint CLI command, the template-free Cross Bomb ticket, and an iOS build from the terminal. Each exercise is 5 min demo + 5–10 min hands-on; anyone who falls behind syncs with one command via ./catchup.sh. (15:00 – 15:15 break) |
| <b>Track B<br/>Art + Tech<br/>Art</b>       | <b>Reskinning Gem Hunter</b> — Producing a 7-gem set from the studio style model, cleanup and the sprite import standard, sprite swaps on the prefabs (through the CLI), adapting the 2D lighting and match VFX to the new palette, in-game verification and the approval package (checklist + provenance + before/after). (15:00 – 15:15 break)                                                                                                                |

### CLOSING — JOINT SESSION

|               |                                                                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 16:45 – 17:30 | <b>The Combined Game</b> — Track A's features + Track B's reskin merge on one branch; the iOS build is made from the terminal. The agent's four traps in foreign code; concrete steps for the next 90 days. |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### PRE-WORKSHOP PREPARATION

|                     |                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Project</b>      | The gem-hunter-workshop repo (Gem Hunter Match + checkpoint branches + com.unity.pipeline) is cloned and has been opened once on participant machines. |
| <b>Accounts</b>     | Engineers: Claude Code access. Art: access to the Scenario style model (backup: a pre-generated gem set).                                              |
| <b>Prerequisite</b> | Completion of the first workshop: participants arrive familiar with plan mode, eval proof and the approval discipline.                                 |
